

Ignacio Iglesias

Senior Full-Stack Engineer · Web · Mobile · Native Desktop · AI-augmented

Garín, Buenos Aires, Argentina · +54 11 6869 7843 · ignacioniglesias@gmail.com · github.com/Pepo2405 · linkedin.com/in/ignacioniglesias2405 · pepo.ar

SUMMARY

Senior full-stack engineer with end-to-end product ownership — from system design and data architecture through the frontend, native mobile app, hardware integration, and production deployment. Uncommon breadth (React/Next.js, React Native/Expo, Rust/Tauri, Node/Bun/PHP backends) paired with depth in system design and legacy migration. Strong focus on **AI-augmented engineering**: I build custom MCP servers, integrate agents and LLMs into production workflows with hard guardrails, and use RAG. Founder profile: built and operate my own SaaS end to end, including its go-to-market.

TECHNICAL SKILLS

- **Languages:** TypeScript, JavaScript, Rust, PHP, Python, SQL
- **Frontend:** React (16–19), Next.js (App Router, Server Actions), Svelte 5, SolidJS, Vite, Tailwind, shadcn/ui, Radix, TanStack Query/Table/Virtual, React Hook Form + Zod
- **Mobile:** React Native, Expo (SDK 55), Expo Router, EAS Build/Submit/Update, NativeWind, Gluestack UI
- **Backend:** Node.js, Bun, Hono, Fastify, Express, Lumen/Laravel, Socket.IO, SSE, BullMQ
- **Databases / ORM:** PostgreSQL, MySQL/MariaDB, SQLite, MongoDB, ClickHouse, Elasticsearch, Qdrant · Prisma, Drizzle, Sequelize, Eloquent
- **Desktop / native:** Tauri 2, Rust, macOS AppKit/OpenGL interop (libmpv render API)
- **AI / Agents:** Model Context Protocol (custom MCP servers), Anthropic Claude API, OpenAI, RAG (Qdrant), Deepgram (real-time transcription), LLM-in-the-loop with guardrails
- **DevOps / Infra:** Docker (multi-stage), Coolify, GitHub Actions (multi-arch builds), GHCR, CI/CD, Playwright, Biome, ESLint, lefthook
- **Integrations:** Auth0, Auth.js, Mercado Pago, Stripe, e-invoicing (AFIP/DGI), ZKTeco biometric hardware, Web Push/VAPID

EXPERIENCE

PXSOL — Orchestrator (AI-augmented Full-Stack Engineer) · prev. Sr. Frontend Engineer

Nov 2024 – Present · Hotel management platform (PMS) + restaurant POS

- **Huésped+ — Argentina's first AI-agentic hotel:** built the guest-experience PWA, now in production with real hotels. Digital check-in and check-out, QR menus and digital ordering, hotel directory, room service, in-app payments, post-stay surveys, and a task/maintenance app for staff.
- **AI virtual concierge:** LLM agent *grounded* on the hotel's published content (services, hours, policies, local tourism) and on the guest's own stay data; multilingual, with anti-hallucination guardrails and hand-off to the front desk when it doesn't know.

- **Ship full-stack features by orchestrating AI agents end to end** — I drive development through fleets of coding agents (custom MCP tooling, guardrails, review loops) rather than writing everything by hand, delivering across the whole stack at high throughput.
- Lead the **migration strategy** from a legacy monolith (PHP/Lumen, ~14,500 files, ~300 models) to a modern stack (Fastify + Prisma + PostgreSQL), using a "proxy + selective greenfield" approach to migrate domains without disrupting operations.
- **Table Floor Plan (hotel F&B suite)**: built the food-and-beverage module — interactive drag-and-drop floor-plan editor, digital orders, integrated payment processing and e-invoicing.
- **Multi-OTA Channel Manager**: built distribution integrations syncing availability, rates and restrictions across channels such as Despegar and Airbnb plus the direct website, giving centralized control over sales.
- **Seasonal Revenue Management**: built the dynamic-pricing system — automated, bulk, granular seasonal rate deployment to maximize revenue.
- Primary contributor to **pxsol-next** (Next.js/TypeScript): 850+ commits across PMS features, QR short-links, and dense data grids with AG-Grid; reverse-engineered undocumented legacy subsystems (a 4-layer automation engine) and authored migration specs with gap analysis.
- Designed **Prisma schemas** for entire domains (polymorphism via Zod, JSONB i18n, versioning, audit logs, soft deletes) and **multi-tenant** architecture with per-tenant data integrity.
- Built **custom MCP servers** (`mcp-mysql`, `pxsol-db`) exposing schema, queries and tooling to AI agents; contributed to the **AI-powered internal CRM** (`pxsol-ventas`): real-time transcription (Deepgram), RAG with Qdrant, BullMQ queues.

GymAdmin / Heavify — Founder & Lead Engineer (own product)

Apr 2024 – Present · Gym-management SaaS (LATAM) — gym-admin.com.ar

- **End-to-end ownership** of a production SaaS: backend, web dashboard, client PWA, native mobile app, hardware software, and deployment infrastructure. ~615 commits, ~108k lines, sole author for 2+ years.
- **Backend + Web**: Hono + Prisma 6 API over PostgreSQL (64 models in a modular schema, 53 route groups), a dense Next.js 16 dashboard with virtualized tables, real-time via Socket.IO, and Mercado Pago payments (webhooks). Installable PWA with per-instance dynamic icons and Web Push.
- **Mobile (Heavify)**: native React Native/Expo (SDK 55) app with role-based routing (client/staff/trainer), ~40k lines, full EAS Build/Submit/Update pipeline to the App Store and Play Store.
- **Hardware integration**: Python desktop client bridging ZKTeco biometric readers to the backend over WebSocket, with local matching, template sync, and at-rest encryption (Fernet) — protocol designed from scratch.
- **Incremental migration** of Next.js Server Actions to a versioned REST API (Hono) to enable consumption from the external app, with documented dual auth (cookie + Bearer).
- **DevOps**: multi-stage Dockerfile, GitHub Actions CI with multi-arch builds (Buildx/QEMU), GHCR publishing, and Coolify deployment; cron decoupled from the web process after a production incident.
- **Own product & go-to-market**: complete design system, product definition and personas, direct sales prospecting and outreach.

Ceiboo — Fullstack Web Developer

Jan 2023 – Mar 2024

- **Gestoría Guimel:** led frontend design and development of a system with **role-based access and dynamic rendering**, hierarchical data architecture (Client → Company → Year → Quarter), and an analytics dashboard with financial balances.
 - **Report generation** in PDF and Excel from the browser, and form validation with immediate feedback.
 - Deployed on a **VPS with Docker + Nginx**.
-

SELECTED PROJECTS

- **Forge (Bridges)** — Self-hosted, Obsidian-style team documentation tool, built end to end: Bun server (SQLite + FTS5/BM25, SSE), a Tauri 2 + SolidJS desktop client, and a **custom MCP server** exposing the vault to agents. Bidirectional sync with conflict resolution (optimistic versioning + 409), multi-token RBAC, and cross-platform release CI/CD.
 - **Goblin** — Desktop streaming app in Tauri 2 + Rust + Svelte 5 with a native MPV player; **low-level Rust↔AppKit/OpenGL interop** (video composited behind a transparent WebView) and applied cryptography for content extractors.
 - **MCP servers** — Several Model Context Protocol servers built from scratch (MySQL exploration, ticket/schema tooling, vault access) used in real development workflows.
-

EDUCATION

- **UTN** — Full Stack Web Development Expert Program, 2022
- **EESC N°23** — High School Diploma in Economics & Administration, 2016

LANGUAGES

- Spanish — native
- English — Upper-intermediate (B2), spoken & written
